Leather is a living material and it's texture will vary in character.

The natural finish can vary, so a new pattern is sometimes imprinted onto the surface, so-called "embossed" or "printed" leather.

Leather is built up of fibres. This fibre structure varies with each animal.

The fibre structure in leather is elastic and stretches, something to consider when trying on leather clothes.

Leather is very heat resistant compared to textiles and is only vaguely influenced by friction heat resulting from a fall.

The strength of leather cannot be judged by touch or vision.

The elasticity in the fibre structure and its thickness determines its strength and resistance in an accident.

Therefore leather should be regularly greased to prevent the fibres from drying out.

The usual way of dyeing leather is in a large bath or by detailing on the surface. Mechanical treatment is used to achieve a used look.

Design of the seams and choice of thread are two other parameters influencing the quality of the product.

Leather garments should be cleaned and impregnated regularly to keep the quality of the leather and thread.
